AVAILABILITY OF UNPUBLISHED STATISTICS

The ABS offers a range of unpublished statistics from the Labour Force Survey. This information may be made available in the following forms: computer printout; microfiche; or on floppy disk. Generally, a charge is made for providing unpublished statistics.

Any queries regarding the availability of unpublished statistics should be directed to SueWalshaw on (08) 237 7438.

MAIN FEATURES

NOTE: Care should be taken in the interpretation of month-to-month movements in the original and seasonally adjusted data - see paragraphs 27 to 30 of the Explanatory Notes. Readers are advised that the last six months' trend estimates are provisional, and could change when data for future months are available - see paragraphs 31 to 33 of the Explanatory Notes for further details.

- Trend estimates indicate a continued deterioration in total employment over the 3 months to May 1991, having peaked in August/September 1990. For males the peak was in June 1990 while for females it was in November 1990.

EMPLOYED PERSONS: TREND SERIES

Indicates a change in definition — see paragraphs 15 and 16 of the Explanatory Notes for further details.

- In seasonally adjusted terms, the number of employed persons has fallen 7,400 (1.1 per cent) over the 3 months to May 1991, with both males and females having suffered a similar percentage fall. Over the 12 months to May 1991, there was an overall fall in employed persons of 6,900 (1.0 per cent). This resulted from a decrease of 10,800 (2.8 per cent) in male employment and in increase of 3,900 (1.4 per cent) in female employment. The decrease in male employment represents a fall of 13,500 (3.4 per cent) from its June 1990 peak of 394,700 while in contrast, female employment has recorded a decrease only in the last quarter.
- In original terms, there was a decrease of 6,800 (1.0 per cent) in employed persons over the 12 months to May 1991. This figure obscures an even more serious fall of 20,900 (4.1 per cent) in those employed full-time, a fall which was only partly offset by an increase of 14,000 (9.0 per cent) in those employed part-time.
- Males and females were affected differently. Male full-time employment dropped by 18,000 (5.0 per cent), while for females there was a fall of only 3,900 (1.9 per cent). The fall in full-time employed males was most pronounced in the 15-19 and 60-64 age groups. For females, a sharp fall in the 15-24 age group was partially offset by an increase in the 45-59 age group.
- Underlying the fall of 6,800 in employed persons was a fall of 13,300 in wage and salary earners which was partly offset by an increase of 6,500 in the number of employers, self-employed and un-paid family helpers.
- Employment in manufacturing showed a sharp fall of 10,900 (9.2 per cent) over the year, with transport and storage recording a fall of 4,200 (14.1 per cent). However, finance, property and business services showed an increase of 8,500 (14.4 per cent), followed by recreation, personal and other services up 5,300 (11.5 per cent) and construction up 3,800 (10.7 per cent). The only occupational groups to suffer a decrease in employment were the tradespersons and clerks groups, falling by 9,900 (9.4 per cent) and 8,300 (7.8 per cent) respectively.
- Trend estimates of the number of unemployed persons have been increasing since October 1989 and stand at 71,700 in May 1991, exceeding the May 1983 peak of 68,500.

UNEMPLOYED PERSONS: TREND SERIES

Indicates a change in definition — see paragraphs 15 and 16 of the Explanatory Notes for further details.

- In seasonally adjusted terms, the number of unemployed persons increased by 17,400 (33.2 per cent) to 69,800 over the year to May 1991. This represents an increase in the unemployment rate of from 7.3 per cent in May 1990 to 9.6 per cent in May 1991, the increase being fairly evenly distributed between males (up 35.5 per cent) and females (up 30.0 percent).

PARTICIPATION RATE: TREND SERIES

Indicates a change in definition — see paragraphs 15 and 16 of the Explanatory Notes for further details.

- Trend estimates of the participation rate have continued the downturn evident last quarter and have fallen from the peak of 63.4 per cent for the October 1990 to January 1991 period to 63.1 per cent in May 1991.

Regions of South Australia

- Original data show that a fall over the year to May 1991 of 8,600 (1.8 per cent) in the number of employed persons in the Adelaide Statistical Division compared with an increase of 1,800 (1.0 per cent) in the Balance of South Australia. At the extremes, Northern Adelaide fell 8.6 per cent while Northern and Western South Australia increased 7.8 per cent.
- Of the State-wide increase of 17,300 (33.4 per cent) in the unemployed over the year, the increase in the Adelaide Statistical Division was 15,100 (41.0 per cent) compared to only 2,200 (14.7 per cent) in the Balance of South Australia.

EXPLANATORY NOTES

Introduction

This publication contains estimates of the civilian labour force derived from the labour force survey part of the monthly population survey, including estimates for regions of South Australia.

2. Preliminary survey results are published in advance of this more detailed publication in *The Labour Force, Australia, Preliminary* (6202.0).

3. Although emphasis in the population survey is placed on the regular collection of data on demographic and labour force characteristics of the population, supplementary and special surveys of particular aspects of the labour force or of other subjects are carried out from time to time. Statistics from these surveys are published and are available on request. A list of publications on labour force and related topics is given in *The Labour Force, Australia* (6203.0). Recent releases are listed opposite.

The Population Survey

4. The population survey is based on a multi-stage area sample of private dwellings (about 5,000 houses, flats, etc.) and a list sample of non-private dwellings (hotels, motels, etc.), and covers about nine-tenths of one per cent of the population of South Australia. The information is obtained from the occupants of selected dwellings by carefully chosen and specially trained interviewers. The interviews are generally conducted during the two weeks beginning on the Monday between the 6th and 12th of each month. The information obtained relates to the week before the interview week (*i.e.* the reference week).

Scope

5. The labour force survey includes all persons aged 15 and over except:

- (a) members of the permanent defence forces;
- (b) certain diplomatic personnel of overseas governments, customarily excluded from census and estimated populations;
- (c) overseas residents in Australia; and
- (d) members of non-Australian defence forces (and their dependants) stationed in Australia.

Coverage

6. In the labour force survey, coverage rules are applied which aim to ensure that each person is associated with only one dwelling, and hence has only one chance of selection. The coverage rules are, necessarily, a balance between theoretical and operational considerations. Nevertheless, the chance of a person being enumerated at two separate dwellings in the one survey is considered to be negligible.

7. Persons who are away from their usual residence for six weeks or less at the time of interview are enumerated at their usual residence when relevant information can be obtained from other usual residents present at the time of the survey.

Regions of South Australia

8. A number of minor changes to regional boundaries and names were introduced with the implementation of a new sample between September and December 1987 (see paragraph 21 below). These changes have not materially affected the continuity of regional data. The regions used in this publication are standard ABS Statistical Regions (see maps) and do not necessarily correspond with regions adopted by other government authorities.

Population Benchmarks

9. Labour force survey estimates of persons employed, unemployed and not in the labour force are calculated in such a way as to add up to the independently estimated distribution of the population aged 15 and over by age and sex. This procedure compensates for underenumeration in the survey, and leads to more reliable estimates. The independent population statistics (benchmarks) are the latest available estimates at the time the labour force survey is conducted, but they usually differ from the official population estimates subsequently published in *Australian Demographic Statistics* (3101.0) because they are necessarily derived from incomplete information about population changes.

10. Regular estimates of the population at the regional level are not available, and so benchmarks for the Adelaide Statistical Division and the Balance of South Australia have been used to produce regional estimates. For this reason, estimates of the civilian population aged 15 years and over are not made available at the regional level.

Revision of Series

11. Survey estimates are not revised for the usually small amendments of population benchmarks arising from new data on deaths and overseas and internal migration. Revisions are made, however, after each census of population and housing, and when population estimation bases are reviewed. These revisions affect unadjusted, seasonally adjusted and trend estimates. The last such revision was made in February 1989 to take account of results of the 1986 Census of Population and Housing, which affected all the monthly estimates from January 1984 to January 1989. For details, see *Information Paper : Revised Labour Force Survey Estimates : January 1984 to January 1989* (6276.0).

12. Following the change in official population estimates to a place of usual residence basis after the 1981 Census, the population benchmarks used in the estimation of labour force survey data are compiled according to place of usual residence. For an explanation of the new conceptual basis of population estimates see *Population Estimates: An Outline of the New Conceptual Basis of ABS Population Estimates* (3216.0). To co-ordinate with the new benchmarks, the labour force survey questionnaire was changed in October 1982 to enable identification of each respondent's place of usual residence. Estimates in this publication for October 1982 onwards are based entirely on place of usual residence. For periods before October 1982, the estimates are based on a combination of place of enumeration and place of usual residence.

13. Until February 1978, surveys were conducted in February, May, August and November each year from 1964. From February 1978 the survey has been conducted on a monthly basis.

14. The questionnaire used in the survey for the collection of labour force data has been revised a number of times the latest occasion being for the April 1986 survey. Details of these changes have been published in *Information Paper: Questionnaires Used in the Labour Force Survey* (6232.0) issued in March 1978, December 1981, August 1984 and June 1986.

15. The latest revision to the questionnaire, in April 1986, follows the extension of the definition of employed persons to include persons who worked without pay for between 1 and 14 hours per week in a family business or on a farm (*i.e.* unpaid family helpers). This new definition aligns the Australian labour force concepts with a set of changed international definitions adopted by the 13th International Conference of Labour Statisticians in October 1982.

16. Previously, such persons who worked 1 to 14 hours or who had such a job but were not at work were defined as either unemployed or not in the labour force, depending on whether they were actively looking for work.

Comparability of Series

17. As noted in paragraph 11, estimates from January 1984 have been revised to conform to revised population estimates following the 1986 Census of Population and Housing, and are thus not strictly comparable with estimates for periods prior to January 1984 which have not been revised.

18. In conjunction with the previous revision of estimates back to February 1978, to conform to revised population estimates, a revision to take account of the current definition of marital status was also applied. Consequently, estimates of marital status contained in this issue are not comparable with estimates published before the February 1984 issue, which classified as married all respondents who reported that they were married or separated. The revision to the marital status classification was undertaken in two parts. Firstly, for all surveys from February 1978, persons who reported that they were separated, were reclassified as not married. Secondly, from June 1983 onwards, the not married category was expanded to also include persons who, although reported as married, did not have a spouse who was a usual resident of the household at the time of the survey.

19. Before October 1982, respondents who stated they were living in a *de facto* arrangement were asked how they would describe their marital status on a population census schedule and the answer was recorded. From October 1982 these respondents were coded as married. This may have resulted in some discontinuity between September and October 1982 in series classified according to marital status.

20. Comparability with estimates produced from the quarterly survey of employment and earnings is affected by the use of a different survey methodology and definitions. The labour force survey provides estimates of people in jobs whereas the survey of employment and earnings provides an estimate of the number of jobs held by wage and salary earners. A more detailed description of the differences between these two series is provided in *Information Paper: Comparison of Employment Estimates from the Labour Force Survey and the Survey of Employment and Earnings* (6263.0).

Survey Sample Redesign

21. The labour force survey sample has been redesigned and resampled using information collected in the 1986 Population Census. The new sample was phased in

over the period September to December 1987. For details, see *Information Paper: Labour Force Survey – Sample Design* (6269.0).

Reliability of the Estimates

22. Estimates in this publication are subject to two sources of error:

- (a) *sampling error*: since the estimates are based on information obtained from occupants of a sample of dwellings, they, and the movements derived from them, may differ from the figures that would have been produced if all dwellings had been included in the survey. As noted in paragraph 10 above, the use of benchmarks in the compilation of regional estimates has not been possible. For this reason users should note that regional estimates may be more volatile than corresponding State estimates and therefore they should not be regarded as reliable indicators of short-term (monthly) movements. More information on sampling error is given in the Technical Notes; and
- (b) *non-sampling error*: inaccuracies may occur because of imperfections in reporting by respondents and interviewers and errors made in the coding and processing of data. These inaccuracies may occur in any enumeration, whether it be a full count or a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.

Differences Between Population Census and Population Survey Estimates

23. The results of the 1986 Census of Population and Housing show that labour force figures derived from the census differ from estimates derived from the labour force surveys.

24. The broad concepts underlying the measures of the labour force and its components, employment and unemployment, are similar in the census and the survey. However there are considerable differences in both the collection methodology adopted (including the detailed questions asked) and estimation procedures. Factors contributing to differences in estimates include: underenumeration in the population census for which census labour force estimates have not been adjusted; the use in the labour force survey of population benchmarks derived from incomplete information about population change (*see* paragraph 9); the inclusion of permanent defence forces in census estimates; the personal interview approach adopted in the survey as opposed to self-enumeration of census schedules; differing questions used to determine labour force characteristics (particularly the identification of unemployed persons); and differing methods of adjustment for non-response to the survey or census.

25. The labour force survey provides detailed and up-to-date estimates of employment and unemployment for Australia, States and Statistical Regions, whereas the census of population and housing provides counts for small areas but in less detail than is available from the survey.

26. These considerations should be borne in mind if comparisons are made between population census and labour force survey estimates.

Seasonal Adjustment

27. Seasonally adjusted series are published in Table 2. Seasonal adjustment is a means of removing the estimated effects of normal seasonal variation from the series so that the effects of other influences on the series can be more clearly recognised. Seasonal adjustment does not remove the irregular or non-seasonal influences which may be present in any particular month. Influences that are volatile can still make it difficult to interpret the movement of the series even after adjustment for seasonal variation.

28. As happens with all seasonally adjusted series, the seasonal factors are reviewed annually to take account of each additional year's original data. The latest review, in February 1991, revised seasonally adjusted and trend monthly series back to February 1978. Information about the method of adjustment, and revised seasonally adjusted and trend estimates for all months back to January 1979, are published in the Appendix to the February 1991 issue of this publication.

29. It is possible that the seasonality of employment, unemployment and labour force participation has been affected by changes introduced during 1987 to the pattern of school holidays.

30. The impact of these changes on seasonally adjusted estimates of labour force characteristics cannot be assessed at this stage.

Trend Estimation

31. Smoothing seasonally adjusted series produces a measure of trend by reducing the impact of the irregular component of the series. The trend estimates are derived by applying a 13-term Henderson-weighted moving average to the respective seasonally adjusted series. These trend series are used to analyse the underlying behaviour of the series over time. Table 2 shows trend estimates for the past 15 months, while the Appendix to the February 1991 issue shows estimates back to January 1979. Trend series graphs are shown on page 5.

32. While this smoothing technique enables estimates to be produced which include the latest month, it does result in revisions to the most recent months as additional observations become available. Generally, subsequent revisions become smaller and, after 3 months, have a negligible impact on the series. There will also be revisions as a result of the annual review of seasonal factors mentioned in paragraph 28.

33. Users may wish to refer to the ABS Information Papers: *A Guide to Smoothing Time Series – Estimate of 'Trend'* (1316.0), and *Time Series Decomposition – An Overview* (1317.0), for more detailed information on producing trend estimates by smoothing seasonally adjusted time series data.

Month-to-month Movements

34. Care should be taken in the interpretation of month-to-month movements in these estimates. Survey estimates are subject to sampling and non-sampling variability as explained in paragraph 22. Particular care should be taken in the interpretation of the recent original and seasonally adjusted monthly movements as these may have been affected by the changed pattern of school

holidays. Trend estimates are expected to be relatively unaffected by these changes.

Semi-logarithmic Graphs

35. A number of the graphs on page 5 have been drawn using logarithmic vertical scales to facilitate comparisons of rates of growth in series of differing magnitude. Equal distances on the vertical scales (over equal time periods) indicate equal rates of growth for those graphs.

37. Current publications produced by the ABS are listed in the *Catalogue of Publications and Products, Australia* (1101.0).

The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.

Unpublished Statistics

38. The ABS can also make available unpublished labour force survey data. Where it is not possible to do so briefly over the telephone, a charge will be levied depending on the amount of data requested and the medium on which they are provided. Inquiries should be made to the officer whose name appears in the Phone Inquiries section of the Inquiries box at the front of this publication, or to Information Services in the nearest ABS office.

TECHNICAL NOTES

1. The labour force survey sample has been redesigned and reselected using information collected in the 1986 Population Census. The new sample was phased in over the period September 1987 to December 1987. For details, see *Information Paper - Labour Force Survey - Sample Design* (6269.0). For more information on sample design estimation procedures and reliability of the estimates for surveys prior to September 1987, reference should be made to the Technical Note in *The Labour Force, Australia, Historical Summary, 1966 to 1984* (6204.0).

Estimation Procedure

2. The labour force estimates are derived from the population survey by use of a complex ratio estimation procedure, which ensures that the survey estimates conform to an independently estimated distribution of the population by age and sex, rather than to the age and sex distribution within the sample itself.

Reliability of the Estimates

3. Two types of error are possible in an estimate based on a sample survey: sampling error and non-sampling error. For an explanation of non-sampling error see paragraph 13. The *sampling error* is a measure of the variability that occurs by chance because a sample, rather than the entire population, is surveyed. Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings, they, and the movements derived from them, are subject to sampling variability; that is, they may differ from the estimates that would have been produced if all dwellings had been included in the surveys. One measure of the likely difference is given by the *standard error*, which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the estimate that would have been obtained if all dwellings had been included, and about nineteen chances in twenty that the difference will be less than two standard errors. Another measure of sampling variability is the *relative standard error* which is obtained by expressing the standard error as a percentage of the estimate to which it refers. The relative standard error is a useful measure in that it provides an immediate indication of the percentage errors likely to have occurred due to sampling, and thus avoids the need to refer also to the size of the estimate.

4. Space does not allow for the separate indication of the standard errors of all estimates in this publication. Standard errors of estimates derived from the survey, and of monthly, quarterly and annual movements for South Australia, and for each region of South Australia, can be determined by using the table on pages 38 and 39.

5. The size of the standard error increases with the level of the estimate, so that the larger the estimate the larger is the standard error. However, it should be noted that the larger the sample estimate the smaller will be the standard error in percentage terms. Thus, larger sample estimates will be relatively more reliable than smaller estimates.

6. As the standard errors in the following table show, the smaller the estimate the higher is the relative standard error. Very small estimates are subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their value for most reasonable uses. In the tables in this publication, only estimates with relative

standard errors of 25 per cent or less, and percentages based on such estimates, are considered sufficiently reliable for most purposes. However, estimates and percentages with larger relative standard errors have been included and are preceded by an asterisk (e.g. *1.5) to indicate they are subject to high standard errors and should be used with caution. See paragraph 9 concerning the derivation of relative standard errors for some estimates.

7. The movement in the level of an estimate is also subject to sampling variability. The standard error of the movement depends on the levels of the estimates from which the movement is obtained rather than the size of the movement. An indication of the magnitude of standard errors of monthly movements is also given in the following table. The estimates of standard error of monthly movements apply only to estimates of movements between two consecutive months. Movements between corresponding months of consecutive quarters (quarterly movements), corresponding months of consecutive years (annual movements) and other non-consecutive months, will generally be subject to somewhat greater sampling variability than is indicated in the table. Standard errors of quarterly movements can be obtained by multiplying the figures in column 1 of the following table by 1.22. Standard errors of all *annual* movements can be obtained by multiplying the figures in column 1 of the following table by 1.3. When using the table to calculate standard errors of movements, refer to the larger of the two estimates from which the movement is derived.

8. Examples of the calculation and use of standard errors are given below:

- (a) From column 1 of the following table it will be seen that an estimate of 300,000 employed persons in South Australia has a standard error of about 4,000. Therefore, there are about two chances in three that the number that would have been obtained if all dwellings had been included in the survey would have been within the range 296,000 to 304,000 and about nineteen chances in twenty that it would have been within the range 292,000 to 308,000.

	Published estimate			
	292,000	296,000	300,000	304,000

← →

19 chances in 20 that, if all dwellings were included, the value is in this range

- (b) Suppose that there is an increase of 10,000 in the number of employed persons from one month to the next.

Column 3 in the following table relates the standard error of the monthly movement to the larger of the two estimates from which the movement is derived. In this case, if the larger of the two

estimates from which the movement is derived was 300,000, from column 3 it will be seen that the standard error of the monthly movement is about 2,700. Therefore, there are about two chances in three that if all dwellings had been included in the surveys the movement would have been within the range +7,300 to +12,700 and about nineteen chances in twenty that it would have been within the range +4,600 to 15,400.

9. The relative standard errors of estimates of *average hours worked*, *average duration of unemployment* and *median duration of unemployment* are obtained by first finding the relative standard error of the estimates of the total number of persons contributing to the estimate (see column 2 in the following table) and then multiplying the figure so obtained by the following relevant factors:

Average hours worked: 0.7
Average duration of employment: 1.3
Median duration of unemployment: 2.0

10. An example of the calculation of standard errors by the use of these factors is as follows:

If an estimate of median duration of unemployment for unemployed females is 16 weeks and the number unemployed is estimated as 20,000, from column 2 of the following table it can be estimated that this figure (20,000) has a relative standard error of about 7.0 per cent. The *relative standard error* of the estimate of median duration of unemployment is calculated by multiplying this

figure (7.0) by the appropriate factor shown in the previous paragraph (in this case 2.0): $7.0 \times 2.0 = 14.0$ per cent. The *standard error* of this estimate of median duration of unemployment is therefore 14.0 per cent of 16, i.e. about 2. Therefore there are about two chances in three that the median duration of unemployment for unemployed females that would have been obtained if all dwellings had been included in the survey would have been within the range 14 to 18 weeks, and about nineteen chances in twenty that it would have been within the range 12 to 20 weeks.

11. Proportions and percentages (for example, participation rates) formed from the ratio of two estimates are also subject to sampling error. The size of the error depends on the accuracy of both the numerator and denominator. The formula for the relative standard error (RSE) of a proportion or percentage is given below:

$$\text{RSE}(x/y) = \sqrt{[\text{RSE}(x)]^2 - [\text{RSE}(y)]^2}$$

12. Standard errors contained in the following table are designed to provide an average standard error applicable for all monthly labour force survey estimates. Analysis of the standard errors for South Australia applicable to particular survey estimates has shown that the standard errors of estimates of employment are generally equivalent to those shown in the following table, while standard errors for unemployment and not in the labour force are approximately 3 per cent and 11 per cent respectively higher than those shown in the table. Standard errors of estimates of persons born in Australia are approximately the same as those shown in the table. For aggregate estimates of persons born outside Australia the standard errors are about 15 per cent higher. The standard errors vary for individual countries of birth, but are generally less than 10 per cent higher.

13. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by respondents, errors made in collection such as in recording and coding data, and errors made in processing the data. Inaccuracies of this kind are referred to as the *non-sampling error* and they may occur in any enumeration, whether it be a full count or a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.

Employment status: Persons in the labour force classified according to whether they are employed or unemployed.

Persons in the labour force are those persons who, during the reference week, were working for pay or profit, or working without pay in a family business or trade, or working without pay in a non-family business, or working without pay in agriculture, forestry and fisheries, or working without pay in mining, quarrying and construction, or working without pay in manufacturing, repair, maintenance, distribution, hotel and restaurant, or working without pay in transport, communications, storage and handling, or working without pay in finance, insurance, real estate, rental, hiring and business services, or working without pay in government, defence, public administration, education, health and welfare, or working without pay in recreation, culture and sport, or working without pay in personal, social and community services, or working without pay in other service industries.

Full-time workers: Employed persons who usually work 35 hours or more a week for all jobs and others through usually working less than 35 hours a week for all jobs and others worked 35 hours or more during the reference week.

Hours of workers: Employed persons classified by whether they were employers, self-employed persons, wage and salary earners (employees), or unpaid family helpers.

(a) See Technical Notes paragraph 7 for details on calculating standard errors for quarterly and annual movements.

(b) For standard errors, etc. for earlier periods, see previous issues of this publication.

(c) Comprises Yorke and Lower North, Northern and Eyre Statistical Divisions.

(d) Comprises Outer Adelaide, Murray Lands and South East Statistical Divisions.

SE standard error RSE relative standard error SEM standard error of monthly movements

— Indicates the point at which the relative standard error (RSE) of level estimates for the given region becomes greater than 25 per cent. Note that for estimates of average hours worked, and average median durations of unemployment, adjustment factors must be applied before the 25 per cent relative standard error level can be derived (see paragraph 9 of the Technical Notes for further details).

GLOSSARY

Actively looking for work: Includes writing, telephoning or applying in person to an employer for work; answering a newspaper advertisement for a job; checking factory or Commonwealth Employment Service noticeboards; being registered with the Commonwealth Employment Service; checking or registering with any other employment agency; advertising or tendering for work; and contacting friends or relatives.

Aggregate hours worked: The total number of hours a group of employed persons has actually worked during the reference week, not necessarily hours paid for.

Average hours worked: Aggregate hours worked by a group divided by the number of persons in that group.

Average duration of unemployment: For a group of unemployed persons, the aggregate duration of unemployment divided by the number of persons in the group.

Duration of unemployment: The period from the time a person began looking for work or was stood down, to the end of the reference week. Thus, the survey measures current (and continuing) periods of unemployment rather than completed spells. For persons who may have begun looking for work while still employed, the duration of unemployment is defined as the period from the time the person last worked full-time for two weeks or more to the end of the reference week.

Employed: Persons aged 15 years and over who, during the reference week:

- (a) worked for one hour or more for pay, profit, commission or payment in kind in a job or business, or on a farm (comprising employees, employers and self-employed persons); or
- (b) worked for one hour or more without pay in a family business or on a farm (*i.e.* unpaid family helpers); or
- (c) were employees who had a job but were not at work and were: on paid leave; on leave without pay for less than four weeks up to the end of the reference week; stood down without pay because of bad weather or plant breakdown at their place of employment for less than four weeks up to the end of the reference week; on strike or locked out; on workers compensation and expected to be returning to their job; or receiving wages or salary while undertaking full-time study; or
- (d) were employers, self-employed persons or unpaid family helpers who had a job, business or farm, but were not at work.

Employment status: Persons in the labour force classified according to whether they are employed or unemployed.

Full-time workers: Employed persons who usually work 35 hours or more a week (in all jobs) and others who, although usually working less than 35 hours a week, worked 35 hours or more during the reference week.

Industry: Classified according to the Australian Standard Industrial Classification (ASIC) 1983 (1201.0 and 1202.0).

Labour force: For any group, persons who were employed or unemployed, as defined.

Labour force status: A classification of the civilian population aged 15 years and over into employed, unemployed or not in the labour force, as defined. The definitions conform closely to the international standard definitions adopted by the International Conferences of Labour Statisticians.

Marital status: Persons are classified as married (husband and wife) if they are reported as being married (including *de facto*) and their spouse was a usual resident of the household at the time of the survey. The not-married category comprises persons who have never married, or are separated, widowed or divorced, as well as those who, although reported as being married, did not have a spouse who usually lived in the household.

Median duration of unemployment: The duration which divides unemployed persons into two equal groups, one comprising persons whose duration of unemployment is above the median, and the other, persons whose duration is below it.

Not in the labour force: Persons who were not in the categories employed or unemployed, as defined. They include persons who were keeping house (unpaid), retired, voluntarily inactive, permanently unable to work, persons in institutions (hospitals, gaols, sanatoriums, etc.), trainee teachers, members of contemplative religious orders, and persons whose only activity during the reference week was jury service or unpaid voluntary work for a charitable organisation.

Occupation: Classified according to the Australian Standard Classification of Occupations (ASCO) 1986 (1222.0).

Participation rate: For any group, the labour force expressed as a percentage of the civilian population aged 15 years and over in the same group. Participation rates for persons classified by birthplace are calculated using population estimates which exclude those in institutions.

Part-time workers: Employed persons who usually worked less than 35 hours a week and who did so during the reference week.

Seasonally adjusted series: A time series of estimates with the estimated effects of normal seasonal variation removed. See paragraphs 27 to 30 of the Explanatory Notes for more detail.

Status of worker: Employed persons classified by whether they were employers, self-employed persons, wage and salary earners (employees), or unpaid family helpers.

Trend series: A smoothed seasonally adjusted series of estimates. See paragraphs 31 to 33 of the Explanatory Notes for more detail.

Unemployed: Persons aged 15 years and over who were not employed during the reference week, and:

(a) had actively looked for full-time or part-time work at any time in the four weeks up to the end of the reference week and:

(i) were available for work in the reference week, or would have been available except for temporary illness (*i.e.* lasting for less than four weeks to the end of the reference week); or

(ii) were waiting to start a new job within four weeks from the end of the reference week and would have started in the reference week if the job had been available then; or

(iii) were available for work in the reference week, or would have been available except for temporary illness (*i.e.* lasting for less than four weeks to the end of the reference week); or

(iv) were waiting to start a new job within four weeks from the end of the reference week and would have started in the reference week if the job had been available then; or

(v) were available for work in the reference week, or would have been available except for temporary illness (*i.e.* lasting for less than four weeks to the end of the reference week); or

(vi) were available for work in the reference week, or would have been available except for temporary illness (*i.e.* lasting for less than four weeks to the end of the reference week); or

(vii) were available for work in the reference week, or would have been available except for temporary illness (*i.e.* lasting for less than four weeks to the end of the reference week); or

(viii) were available for work in the reference week, or would have been available except for temporary illness (*i.e.* lasting for less than four weeks to the end of the reference week); or

(ix) were available for work in the reference week, or would have been available except for temporary illness (*i.e.* lasting for less than four weeks to the end of the reference week); or

(x) were available for work in the reference week, or would have been available except for temporary illness (*i.e.* lasting for less than four weeks to the end of the reference week); or

(xi) were available for work in the reference week, or would have been available except for temporary illness (*i.e.* lasting for less than four weeks to the end of the reference week); or

(xii) were available for work in the reference week, or would have been available except for temporary illness (*i.e.* lasting for less than four weeks to the end of the reference week); or

(xiii) were available for work in the reference week, or would have been available except for temporary illness (*i.e.* lasting for less than four weeks to the end of the reference week); or

(xiv) were available for work in the reference week, or would have been available except for temporary illness (*i.e.* lasting for less than four weeks to the end of the reference week); or

(xv) were available for work in the reference week, or would have been available except for temporary illness (*i.e.* lasting for less than four weeks to the end of the reference week); or

(xvi) were available for work in the reference week, or would have been available except for temporary illness (*i.e.* lasting for less than four weeks to the end of the reference week); or

(xvii) were available for work in the reference week, or would have been available except for temporary illness (*i.e.* lasting for less than four weeks to the end of the reference week); or

(xviii) were available for work in the reference week, or would have been available except for temporary illness (*i.e.* lasting for less than four weeks to the end of the reference week); or

(xix) were available for work in the reference week, or would have been available except for temporary illness (*i.e.* lasting for less than four weeks to the end of the reference week); or

(xx) were available for work in the reference week, or would have been available except for temporary illness (*i.e.* lasting for less than four weeks to the end of the reference week); or

(xxi) were available for work in the reference week, or would have been available except for temporary illness (*i.e.* lasting for less than four weeks to the end of the reference week); or

(b) were waiting to be called back to a full-time or part-time job from which they had been stood down without pay for less than four weeks up to the end of the reference week (including the whole of the reference week) for reasons other than bad weather or plant breakdown.

Unemployed looking for full-time work: Unemployed persons who actively looked for full-time work or were to resume a full-time job, from which they had been stood down.

Unemployed looking for part-time work: Unemployed persons who had actively looked for part-time work only, or were to resume a part-time job, from which they had been stood down.

Unemployment rate: For any group, the number of unemployed persons expressed as a percentage of the labour force in the same group.

EARLY RELEASE OF FINAL LABOUR FORCE ESTIMATES

New Service

- Final labour force estimates are now available on subscription as a special data service well before the release of *The Labour Force, Australia* (6203.0). As part of this new service, clients will be able to specify the data items they require and set out formats of tables to suit their personal needs. It will also be possible to specify the medium (hard copy, disk, electronic mail) of their choice.
- Subscription orders only will be catered for initially although it is envisaged that the service will be extended to include ad hoc requests at a later date.

Data detail

- All the data in 6203.0 including status of worker, industry and occupation will be available. **State and regional data not ordinarily available before the release of 6203.0 can also be ordered.**

Timing

- Under this special new service, data are expected to be available within a week after the release of *The Labour Force, Australia, Preliminary* (6302.0) and up to two weeks ahead of the final publication. Data will be despatched when available, rather than on a fixed schedule.

Cost

- The cost of this service will vary according to the level of detail required. However, the charging will follow the normal schedule for ad hoc user requests with substantial discounts for subscriptions.

Inquiries

- Inquiries concerning the new service should be directed to Heather Crawford on (06) 252 6525 or any ABS State office.

LABOUR FORCE SUPPLEMENTARY AND SPECIAL SURVEYS

Listed below are some recent Australian publications produced from supplementary and special surveys. Equivalent State data and special tabulations are available, subject to statistical reliability.

Title of publication	Catalogue No.
<i>Employment Benefits</i> , Annual, August 1990	6334.0
<i>Job Search Experience of Unemployed Persons</i> , Annual, July 1990	6222.0
<i>Labour Force Experience</i> , Annual, March 1990	6206.0
<i>Labour Force Status and Educational Attainment</i> , Annual, February 1990	6235.0
<i>Labour Force Status and Other Characteristics of Families</i> , Annual, June 1990	6224.0
<i>Labour Force Status and Other Characteristics of Migrants</i> , Three-yearly September 1990	6250.0
<i>Labour Mobility</i> , Annual, February 1990	6209.0
<i>Persons Not in the Labour Force</i> , Annual, September 1990	6220.0
<i>Persons Who Had Re-entered the Labour Force</i> , May 1990	6264.0
<i>Successful and Unsuccessful Job Search Experience</i> , Two-yearly, July 1990	6245.0
<i>Trade Union Members</i> , Two-yearly, August 1990	6325.0
<i>Transition From Education to Work</i> , Annual, May 1990	6227.0
<i>Weekly Earnings of Employees (Distribution)</i> , Annual, August 1990	6310.0

* RECENTLY RELEASED LABOUR STATISTICS PUBLICATIONS *

Labour Statistics, Australia, 1989

This publication provides a wealth of information, including time series statistics, on the Australian labour market in tabular and graphical forms. Selected features highlight some of the more significant elements and trends.

Aspects of the Australian labour market covered in the publication include:

- socio-demographic characteristics of the labour force
- employment, unemployment and underemployment
- persons not in the labour force
- award rates, labour costs and employment benefits
- hours worked, industrial relations, training expenditure
- international comparisons

The cost of this 166-page publication (Catalogue No. 6101.0) is \$25.00.

Award Coverage Australia, May 1990

(Previously: *Incidence of Awards, Australia*)

This publication contains details of the award coverage of employees. Details were obtained from a sample survey and are based on responses to a question which asked if employees were covered by an award, determination or collective agreement. This information is cross-classified by other data items such as State, gender, sector, jurisdiction, employee category, industry, occupation, etc.

An Appendix sets out how to order a range of unpublished data to meet your requirements.

The cost of this publication (Catalogue No. 6315.0) is \$12.00.

Industrial Disputes, Australia, 1990

This publication was last released for 1988 and shows annual statistics of industrial disputes in more detail (e.g. more industry and State data) than previously published in *Industrial Disputes, Australia* (6321.0), issued monthly. Other information such as a distribution of the number of employees involved and working days lost is also included, as well as a number of 6 year time series for Australia and the States.

The cost of this publication (Catalogue No. 6322.0) is \$14.00.

The above publications can be obtained from the ABS Bookshop in your State capital city as listed below:

For more information ...

The ABS publishes a wide range of information on Australia's economic and social conditions. A catalogue of publications and products is available from any of our Offices (see below for contact details).

Information Consultancy Service

Special tables or in-depth data investigations are provided by the ABS Information Consultancy Service in each of our Offices (see below for contact details).

Electronic Data Services

A growing range of our data is available on electronic media. Selections of the most frequently requested data are available, updated daily, on DISCOVERY (Key *656#). Our TELESTATS service delivers major economic indicator publications ready to download into your computer on the day of release. Our AUSSSTATS service enables on-line access to a data base of thousands of up-to-date time series. Selected data sets are also available on diskette or CD-ROM. For more details on our electronic data services, contact Information Services in any of our Offices on the numbers below.

Bookshops and Subscriptions

There are over 500 titles available from the ABS Bookshops in each of our Offices. You can also receive any of our publications on a regular basis. Join our subscription mailing service and have your publications mailed to you in Australia at no additional cost. Telephone our Publications Subscription Service toll free on 008 02 06 08 Australia wide.
